Challenge 2

Building Forms with Angular

Our API endpoints are ready. Now we need a form to add a new vehicle. This form should include the following fields:

- **Make** (drop-down list)
- **Model** (drop-down list)
- **Is this vehicle registered?** (2 radio buttons, yes and no)
- **Features** (check box list)
- **Contact Name** (text box)
- **Contact Phone** (text box)
- **Contact Email** (text box)

The makes drop-down list should be populated with the makes returned from our API. When we select a make, the models drop-down list should be populated with only the models available for the selected make.

The features check box list should include the features returned from our API. The user should be able to select multiple features.

For all input fields, when we click a label, the input field below it should get focus.

This challenge is all about client-side programming, more specifically Angular and Bootstrap. Given that Angular is one of the pre-requisites of the course, you should have all the necessary knowledge to complete this task.
